Git Repository Migration and Remote Switching Guide

1. Push your repository to GitHub:

   git push origin master

   git push origin storm

   git push origin --tags

2. Create a new repository on GitHub:

   - Go to https://github.com/new

   - Name the repository (e.g., my-second-repo)

3. Change the remote to point to the new GitHub repository:

   git remote rename origin original-origin

   git remote add origin https://github.com/your-username/my-second-repo.git

4. Push to the new repository:

   git push origin master

   git push origin storm

   git push origin --tags

5. Restore the original remote settings:

   git remote remove origin

   git remote rename original-origin origin

Now you're back to using the original GitHub repository as your remote.
